

SPIKES AND SPIKE SHOES

Track Audio spikes are incorporated as part of our isolation feet and precision stands, and are also available separately for use with conventional spiked loudspeakers and equipment racks.

Give your loudspeakers the firm footing they deserve with our precision-machined spikes, exquisitely designed in high quality stainless steel to eliminate micro-vibrations. Available in a range of popular sizes, the spikes fit very tightly into the threads, and a threaded adjuster and locking ring allow you to make highly accurate height adjustments. The spike profile is designed to easily penetrate carpets without causing damage and make a perfect mechanical ground with the floor.

Our stainless steel spike shoes, which come in two sizes (and are supplied as standard with our isolation feet or available separately), feature delrin inserts to eliminate resonance and finest quality English felt bases to protect wooden floors. Solid all-stainless steel versions are also available.

"The beautiful jewellery-like quality of these spikes is what will appeal to many. They're little pieces of perfection. Quite possibly the best quality I have ever seen."

DAVID PRICE, HI-FI WORLD, OCTOBER 2011

TRACK AUDIO

Unlock the true potential
of your hi-fi system

GOOD VIBRATIONS?

You wouldn't build a house without strong foundations. Or drive a car with loose suspension. So why expect your hi-fi system to perform at its best without the proper support?

Your hi-fi works by generating sound waves. However for every action, there's a corresponding reaction: in this case, unwanted vibration and resonance. No matter how good your loudspeakers, the in-room audio quality can be significantly reduced by the effects of floor resonance, producing sonic effects ranging from muddy and indistinct bass notes to a harsh and wearing sound.

Track Audio precision-made speaker stands, isolation feet, spikes and spike shoes are designed to eliminate these effects and unlock the full potential of your hi-fi system.

PRECISION, QUALITY AND CONTROL

Track Audio's range of support solutions is the result of detailed analysis into the detrimental effects of floor resonance caused by high-output loudspeaker designs. Every product and component is designed and manufactured in-house in the UK from the highest quality materials, using detailed computer modelling and ultra-precision machining to ensure meticulous attention to detail and excellent performance.

We pay equally careful attention to the sourcing of materials and traceability of all parts and processes. All machined parts are produced to ISO 9001 standards.

ISOLATION FEET

Track Audio isolation feet feature a unique design based around an ingenious viscous damping system. Undesirable vibrations that would normally diminish the performance of your hi-fi are absorbed and converted into heat, leaving you free to hear from your loudspeakers only what the speaker designer intended.

The result: an instant upgrade to your loudspeakers. Fat and muddy bass becomes clean and tuneful. Harsh midrange is now clear and sweet. Stereo soundstaging snaps into holographic focus, and adjacent rooms are less affected by sound leaking through the building.

"Having used Track Audio feet with a variety of speakers in a variety of locations, they've never once disappointed. They've always represented an upgrade over the original items supplied – in some cases significantly so."

"I was ready for the ease of use, slick handling of levelling the speakers and setting their rake angles. What I wasn't expecting was the magnitude of the sonic improvement they wrought."

ROY GREGORY, WWW.THEAUDIOBEAT.COM, DECEMBER 2011

PRECISION SPEAKER STANDS

Track Audio precision stands are hand built to order, incorporating our unique isolation feet (left). They are available as a resonance-damped pillar stand for bookshelf loudspeakers and as a plinth for floor-standing speakers and subwoofers.

A glass spirit level is built into each stand allowing exact levelling, and a sprung-ball click system allows easy and repeatable adjustments for experimentation with tilt, to fine-tune phase coherence adding that last scintilla of reality to the sound. The pillar stands incorporate damping layers to prevent internal resonance within the stand itself. Each pair of stands contains over 160 precision-machined parts.

"I tried these stands [on two brands of speakers]. The effects on both were dramatic. The bass seemed to suddenly gain new levels of depth, clarity and tunefulness. It was more precise in its form and shape. Treble seemed smoother: more detailed and to reach higher, while the midrange opened up to reveal previously masked colours and textures in the music."

TONY BOLTON, HI-FI WORLD, APRIL 2012

"The build class and quality of finish are nothing short of exquisite. Close inspection reveals an obsessive attention to detail. Ease of setting up and levelling is quite the best I've come across in forty years of hi-fi hobbying."

JOHN BAMFORD, HI-FI NEWS, AUGUST 2012
